

# Broadband Infrastructure for Effective Telemedicine Service

Pavan Singh Shakya  
Centre for ICT4D

2nd Telemedicine Workshop, Kathmandu  
March 2019

# Centre for Information and Communication Technology for Development

(ICT4D)

**Mission :** ICT for development and empowerment - by the community to the community

**Vision :** Effective usage of ICT for socio-economic development in PPP model

**Objective :**

- Research - to serve better with their "personalized" requirement
- Collaboration - with community for the community
- Application - relevance and timely
- Assistance and Training - for the community
- Advocacy - Identification of policy gap and to develop strategy

**One of the key challenges to narrow down the digital divide is - effective and sustainable backhaul connectivity in rural areas**

**- a major challenge to provide effective services like telemedicine**

# **What is effective Broadband Service ? Just service or value added service ?**

**A controversial question - Are we leveraging broadband service  
by providing better service for Internet access only ?**

**How does unserved or underserved areas in our country  
get benefit by Broadband Service ?**

# Initiative on Telemedicine

**Project :** Broadband for Health (funded by Asia Pacific Telecommunity (APT) with grant assistance of Government of Japan) and Internet Society

**Objective :**

- Effective usage of broadband infrastructure for various applications
- Selection of appropriate, relevant and applicable hardware solutions for effective health service delivery
- Development of Health Information System for local analysis and effective reporting
- Taking health services to the needy people of rural areas

**Project Area :**

- Dullu Municipality in Dailekh District
- Collaboration with Municipality and District Hospital
- Population to be served : approximately 40,000 in 13 wada

**Equipment to be used :**

- NCT Sistemas mobile/portable telemedicine kit

# The Dullu Network (10 km)

# Objective of Telemedicine : Dullu Experience

- Telemedicine is focusing on tele - which means distance - leads to gaps of technology, quick feedback, and time lag.
- Bridging the Gap – Lack of Doctors, Specialists and Infrastructure
- Centralized Management of Electronic Health Records (Ward Office to Municipality to Hospital to Urban Hospitals)
- De-Centralized Health care delivery and management
- Medical Intelligence on Finger tips (not just medical service but also data analysis)
- Democratizing Affordable Healthcare and saving cost

## Impact of Telemedicine : Dullu Experience

- equal health facility to all people at their door step
- Timely advices to the Doctor in rural area from urban area
- Skill enhancement of Doctors and/or paramedic person in remote areas
- Affordable health services as patient do not need to spend time on transportation and other social obligations
- Minimize migration from rural areas to peri-urban areas
- All in total, telemedicine is about multiple moving parts - Public health, legal experts, technologists, business processes, health care providers. It is complex, but rewarding, when it works.

THANK YOU
